

Weekly Update 1 - Semester 2

Edward Wardell

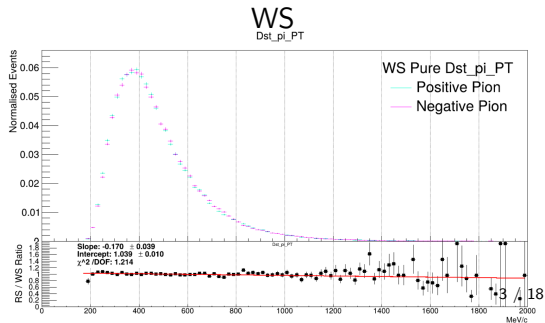

15th January 2025

Tasks Undertaken

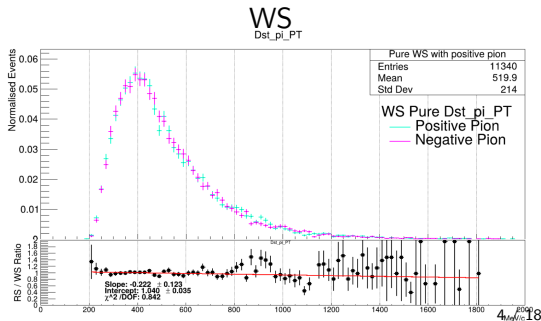

- ▶ Refining Presentation (need to change plot colours, line thickness, etc)
- ▶ Looked into Soft Pion Charge for $D_{st}\pi_{PT}$.
- ▶ 2D Classifier cut for Δm_{ReFit} (WS).
- ▶ Unsupervised Learning!

Soft Pion Charge Differences for Dst_pi_PT.

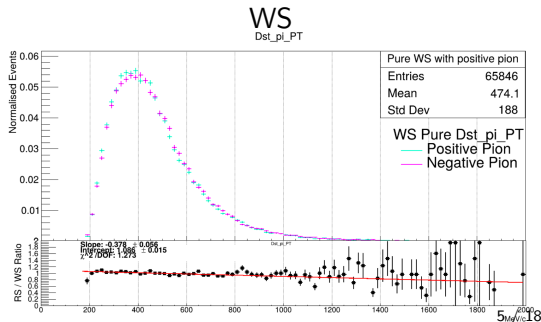

We can see good agreement with RS, WS also quite good agreement (mostly within error-bar range).

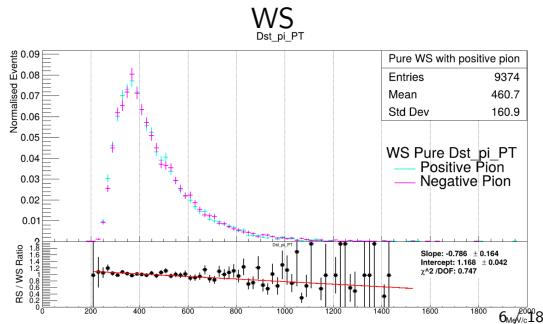

Soft Pion Charge Differences for Dst_pi_PT. deltam_ReFit Signal Region [145.25, 145.80].

Soft Pion Charge Differences for Dst_pi_PT. Δm_{ReFit} higher sideband Region ≥ 148 .

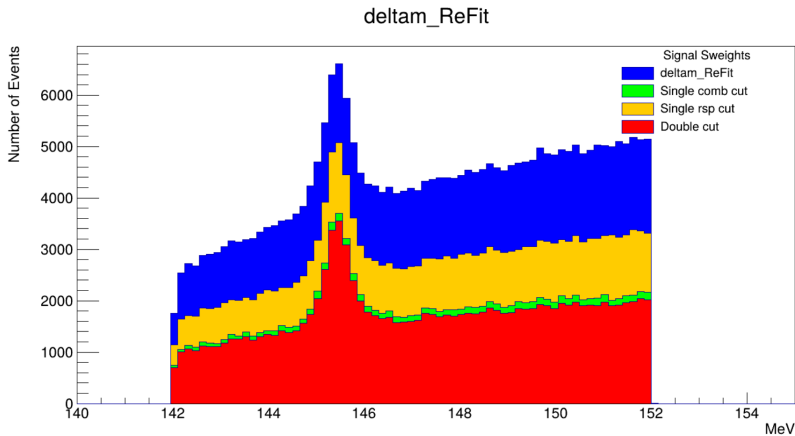

Soft Pion Charge Differences for Dst_pi_PT. Δm_{ReFit} lower sideband Region ≤ 143 .

Dst_pi_PT

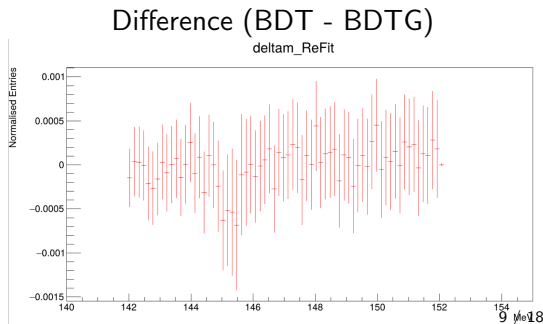

- There seems to be pretty consistent agreement with π_s^+ & π_s^- for different regions of Δm_{ReFit} , at least within error-bar range.

2D Classifier for ΔE_{ReFit} for **BDT**

2D Classifier for ΔE_{ReFit} for **BDT vs BDTG**

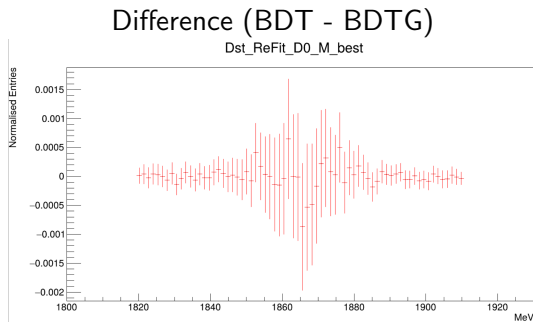

It looks like BDTG is a marginally better discriminator compared to BDT.

Similar story for the D0_MM mass variable (BDTG is slightly better).

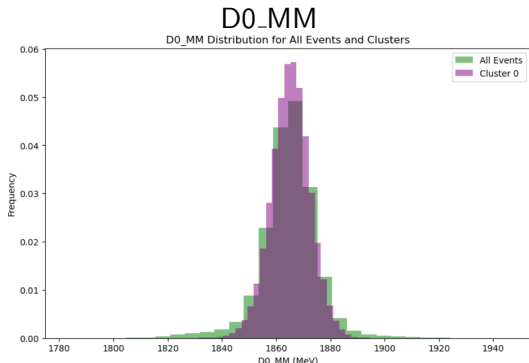

Dst_ReFit_D0_M_best (DFT mass variable).

Unsupervised Learning **RS** - Density Based Clustering and Noise (DBSCAN).

312003 events in the "signal" cluster. 133809 events in the noise cluster.

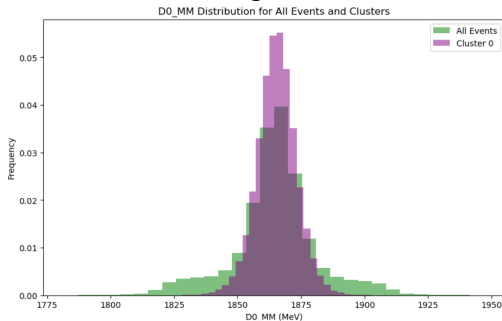

Unsupervised Learning RS - Density Based Clustering and Noise (DBSCAN)

- ▶ We have seen that there isn't incredibly good discrimination of background, it seems most likely that it is better at clustering combinatorial background.
- ▶ I am excited to see if the story changes with the larger dataset.
- ▶ If we consider the two largest Principle Components, we can view the two clusters.

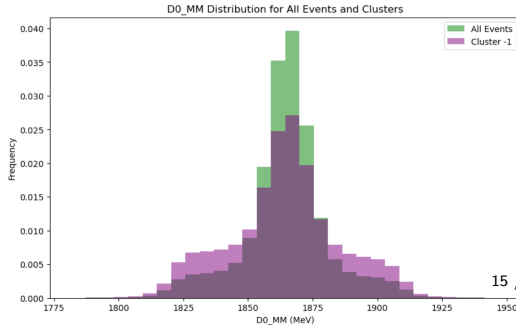

Unsupervised Learning **WS** - Density Based Clustering and Noise (DBSCAN). - Looking at **D0_MM**
 149887 events in the "signal" cluster. 137839 events in the noise cluster.
